EXTERIOR WINDOW FILM INSTALLATION PROCESS

Thank you for considering Solar Vision Inc. for your Exterior Window Film Application! While there are many similarities between an interior and exterior window film application, there is one MAJOR difference between the two, and that is being outdoors. While we can assist with controlling an indoor environment, Mother Nature determines what happens outdoors.

Along with weather; access, and safety are also very important. Not all installs are the same, the ground may be uneven, there could be obstructions, or very high windows requiring a lift or scaffolding. One of our Safety Coordinators may have to review your project before we can provide you with a fair and accurate estimate.

Exterior Window Films are an excellent choice for Colorado's climate! While many of these installations go off without a hitch, its not unheard of for them to be rescheduled a few times either. This is to ensure an optimal environment for a clean and safe application. With that said it'll be **WORTH THE WAIT!**

Weather

- Temps must be at or above **47°F** for installation
- Cannot be installed in rain, sleet, snow, or wind.

Safety

- Any application requiring more than a step ladder will require a site visit from a Solar Vision Safety Coordinator prior to receiving a proposal.

Call us at **303-862-6376** to schedule your estimate or installation.
We look forward to hearing from you!!
